

# Activity 3 (p. 60 #21)

a.  $t_0$  to  $t_2$ . Find  $t_2$

$\Delta y$  ✓  
 $v_{iy}$  ✓  
 $v_{fy}$  ?  
 $a_y$  ✓  
 $\Delta t$  = ?

use no  $v_{fy}$  equation

$$y_f = y_i + v_{iy} \Delta t + \frac{1}{2} a_y \Delta t^2$$

$$y_2 = y_0 + v_{0y} \Delta t + \frac{1}{2} a_y \Delta t^2$$

would need quadratic formula to solve for  $\Delta t$ . Avoid the quadratic formula.

Instead, find  $v_{fy}$  first

$$v_{fy}^2 = v_{iy}^2 + 2a_y \Delta y$$

$$v_{2y}^2 = v_{0y}^2 + 2a_y (y_2 - y_0)$$

$$v_{2y}^2 = (15 \text{ m/s})^2 + 2(-10 \text{ m/s}^2)(0 - 2 \text{ m})$$

$$v_{2y}^2 = 225 \frac{\text{m}^2}{\text{s}^2} + 40 \frac{\text{m}^2}{\text{s}^2}$$

$$v_{2y}^2 = 265 \frac{\text{m}^2}{\text{s}^2}$$

$$v_{2y} = \pm 16.3 \frac{\text{m}}{\text{s}}$$

I choose the negative answer,  $v_{2y} = -16.3 \text{ m/s}$

Now find  $\Delta t$

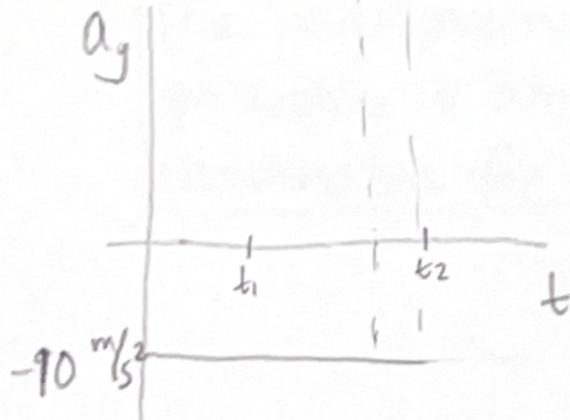

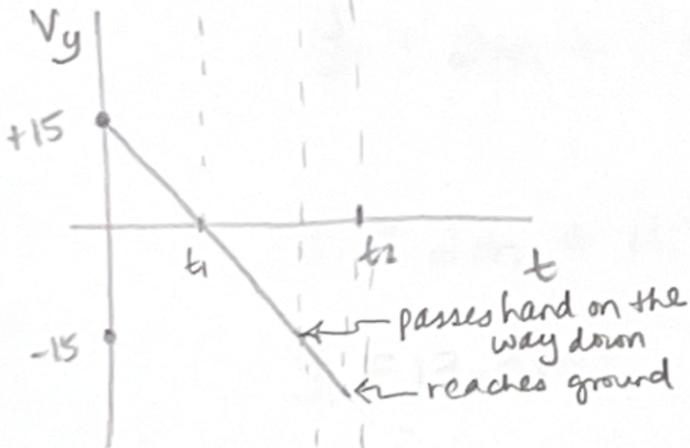

$$v_{fy} = v_{iy} + a_y \Delta t$$

$$v_{2y} = v_{0y} + a_y \Delta t$$

$$\Delta t = \frac{v_{2y} - v_{0y}}{a_y}$$

$$\Delta t = \frac{-16.3 \text{ m/s} - 15 \text{ m/s}}{-10 \text{ m/s}^2} = \boxed{3.13 \text{ s}}$$

The time in the air is 3.1s. This is a reasonable time for a tossed ball

b. Find max height using  $t_0$  to  $t_1$

$\Delta y = ?$

no  $t$  equation

$v_{iy} \checkmark$

$$v_{fy}^2 = v_{iy}^2 + 2a_y \Delta y$$

$v_{fy} \checkmark$

$$v_{iy}^2 = v_{oy}^2 + 2a_y (y_1 - y_0)$$

$a_y \checkmark$

$$v_{iy}^2 - v_{oy}^2 = 2a_y (y_1 - y_0)$$

$\Delta t$

$$\frac{v_{iy}^2 - v_{oy}^2}{2a_y} = y_1 - y_0$$

$$y_0 + \frac{v_{iy}^2 - v_{oy}^2}{2a_y} = y_1$$

$$y_1 = y_0 + \frac{v_{iy}^2 - v_{oy}^2}{2a_y}$$

$$y_1 = 2\text{m} + \frac{(0)^2 - (15\text{m/s})^2}{2(-10\text{m/s}^2)}$$

$$y_1 = 2\text{m} + 11.3\text{m}$$

$$y_1 = 13.3\text{m}$$

The maximum height above ground is 13.3m. This is reasonable for a ball toss.

c. velocity at ground using  $t_0$  to  $t_2$

OH! I already found this in (a).

The velocity of the ball at impact is (16.3m/s, down). This is reasonable because it is greater speed than the upward toss, as it should be since it fell below the toss point on the way down.
